INTELLIGENT CAPACITY PLANNING

Demand moves every week.
Driver numbers do not.
Build the engine that turns
expected demand into the
right drivers, in the right
place, at the right time.

EMX is the logistics
arm of the **7X Group** —
the delivery operator
behind this challenge.
What you build here
has a direct pathway
into EMX and the wider
7X ecosystem.

THE PROBLEM

Delivery companies
can see roughly how
busy the next three

months will be, store
by store. What
nobody can work out

TEAM LOGIN

So the call gets made by hand. Planners estimate how many couriers each store needs, day by day and hour by hour. They decide when to start hiring, and when to bring in outside couriers instead. It rests on experience rather than data, and it misses the things that move the answer: some stores are simply more productive than others, some areas take longer to cover, and people take leave.

Get it wrong and it shows up fast. One store ends up overstaffed while another runs short. Costs climb on one side, deliveries run late on the other, and customers feel both. Hiring is the slowest lever of all, since a permanent courier can take two months to arrive. 7X is looking for a planning capability that turns expected demand into clear

staffing and hiring recommendations, and keeps updating them as demand shifts.

WHAT WE'RE SEEING

A rolling three-month shipment forecast already exists for every store. Nothing turns it into a staffing plan or a hiring decision.

Productivity, delivery times and route lengths vary a lot from store to store. Weekends are consistently busier than weekdays, and leave, days off and shift patterns cut into the capacity that looks available on paper.

The target mix is 60% permanent couriers and 40% outsourced. Permanent hires take 45 to 60 days to arrive and outsourced couriers 5 to 10, so the decision has to be made long before the

demand does.

WHAT A WINNING BUILD LOOKS LIKE

Build a prototype that demonstrates measurable improvement in workforce planning accuracy over the current manual baseline using the provided dataset.

Your solution should show how AI can turn a demand forecast into actionable staffing and hiring decisions — with clear reasoning behind every recommendation.

Judges will evaluate based on the depth of AI implementation, how well the solution addresses

the problem,
technical
execution, and real-
world viability.
